How to build models that convert a
sequence into another sequence?

Understanding Language Translations

Our input will be a sentence in one language and our model should be able to translate it to another language

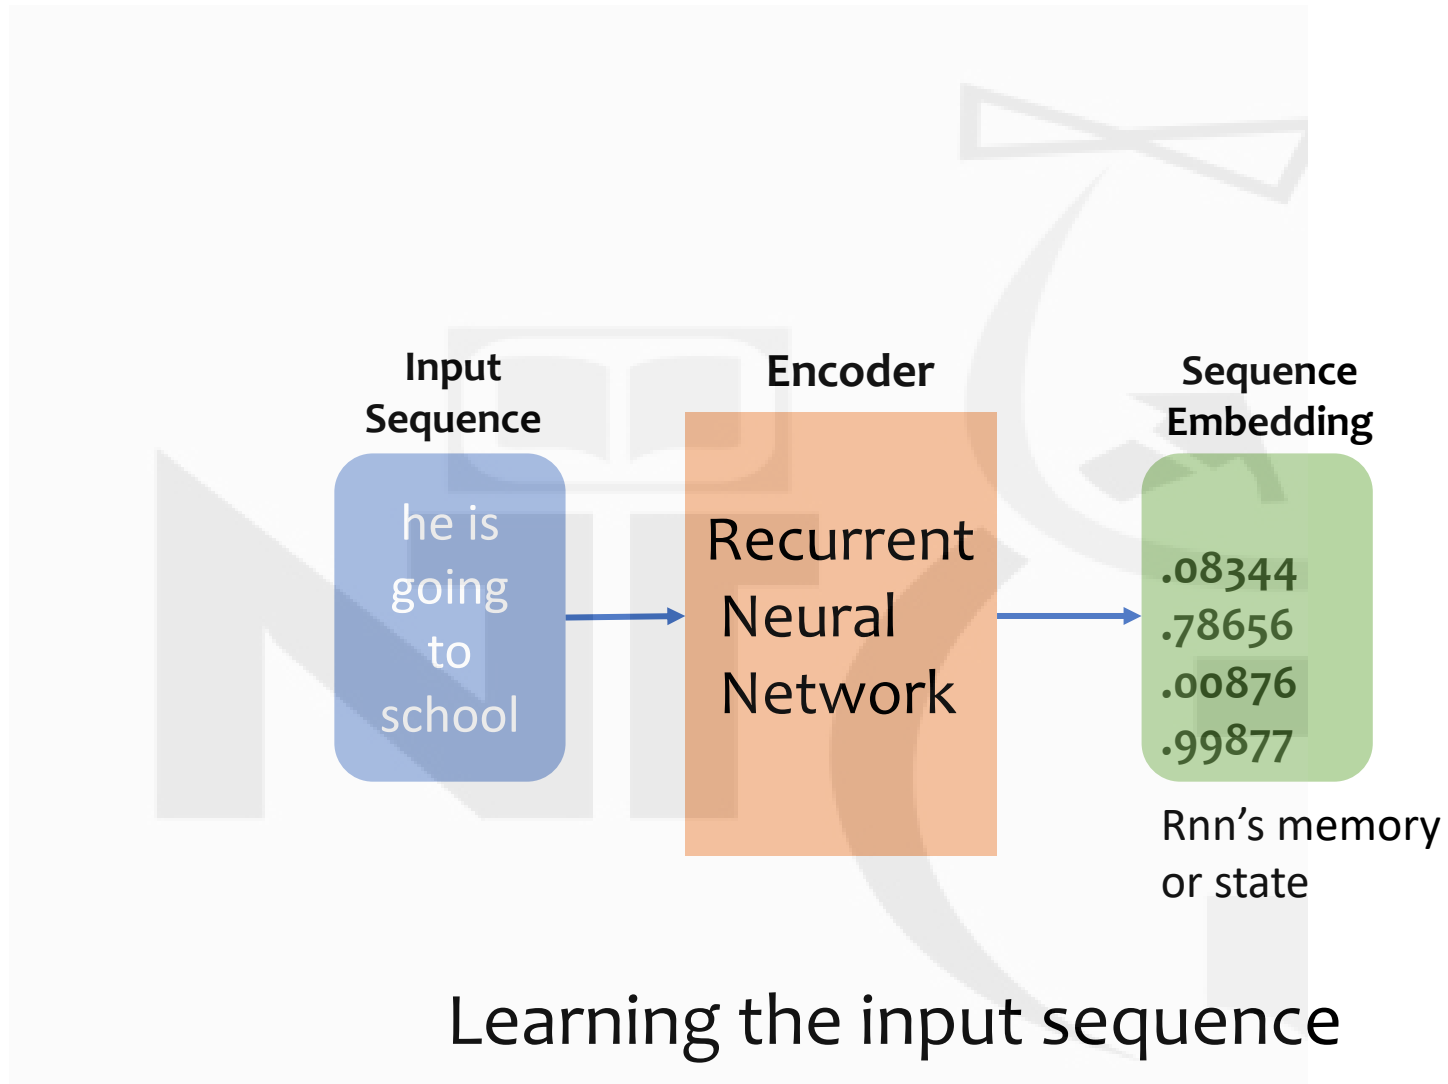

The screenshot shows the Google Translate web interface. On the left, the source language is set to 'English – detected' and the input text is 'I am going to school'. On the right, the target language is set to 'Telugu' and the output text is 'నేను స్కూల్ కి వెళ్తున్నాను.' (Nēnu skūl ki veḷtunnānu.). Below the input and output text are icons for voice input/output and a Google logo. At the bottom right, there are links for 'Open in Google Translate' and 'Feedback'.

Sequence of words in
Source language

Sequence of words in
Target language
OUTPUT

Which model works good with sequences??

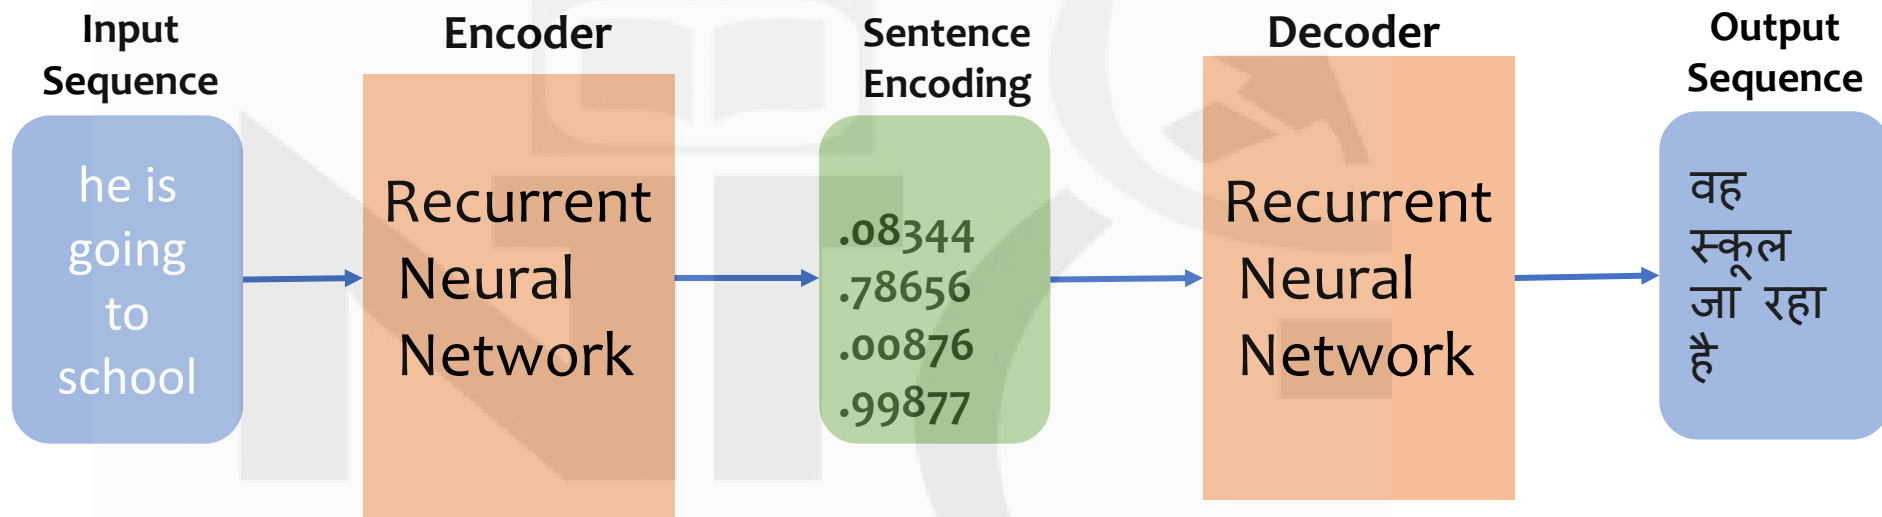

LSTM are very good at understaing a sequence

How do we generate the output
sequence from sequence
embedding??

Then we will take another RNN convert these embeddings into an output sequence

Sequence to Sequence (Seq2Seq) Model

Seq2Seq Model

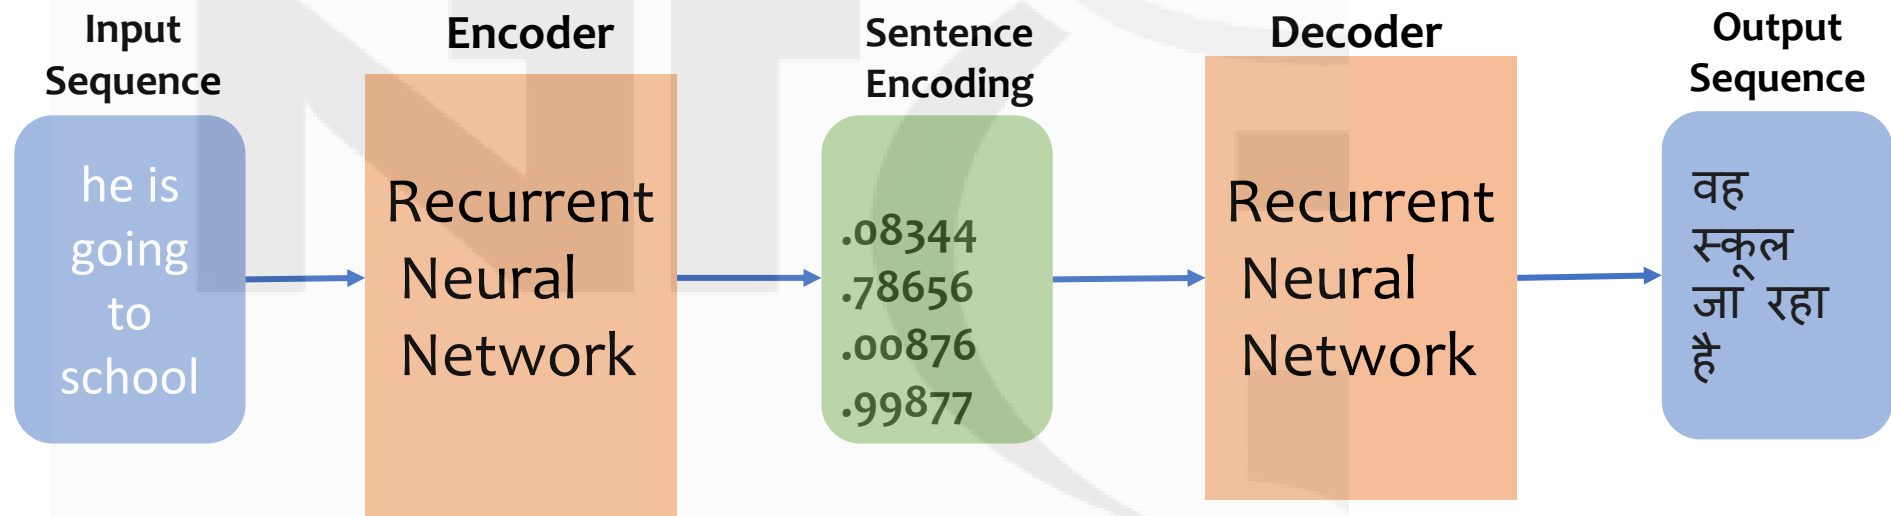

- Google came up with this architecture
- For language translation
- It replaced half a million lines of code with just few hundred lines
- And also, the accuracy was much better replacing human linguistics for translation

No Need to know any rule about human language

Achieved better results than 20 years of work with Statistical Machine Translation

Neural Machine Translation (NMT)

Building Seq2Seq Model in Keras

We will need data first

Tab-delimited Bilingual Sentence Pairs

These are selected sentence pairs from the [Tatoeba Project](#).

Updated: 2024-04-01

-  Afrikaans - English [afr-eng.zip](#) (918)
-  Albanian - English [sqi-eng.zip](#) (449)
-  Algerian Arabic - English [arq-eng.zip](#) (155)
-  Arabic - English [ara-eng.zip](#) (12523)
-  Armenian - English [hye-eng.zip](#) (1804)
-  Assamese - English [asm-eng.zip](#) (4163)
-  Azerbaijani - English [aze-eng.zip](#) (2191)
-  Basque - English [eus-eng.zip](#) (683)
-  Belarusian - English [bel-eng.zip](#) (3938)
-  Bengali - English [ben-eng.zip](#) (6509)
-  Berber - English [ber-eng.zip](#) (152163)

Introducing Anki

- If you don't already use Anki, visit the website at <http://ankisrs.net/> to download a free application for Macintosh, Windows or Linux.

About These Files

- Any flashcard program that can import tab-delimited text files, such as [Anki](#), can use these files.
- **Warning!** There are errors in the Tatoeba Corpus. ([Detailed Warning](#))
- **In order to minimize the number of errors**, I only used sentences that were owned by [identified native speakers working on the Tatoeba Project](#) and sentences that I've personally checked and did not reject.
- **Warning!** Please remember that even doing this may not have eliminated errors.

Let's understand Data Preprocessing

We need to split the downloaded data

I have a car. मेरे पास एक गाड़ी है।
I have a dog. मेरे पास एक कुत्ता है।
I understand. मैं समझता हूँ।
I'm a doctor. मैं डॉक्टर हूँ।
It is a book. यह किताब है।

**RAW DATA
(Language Pairs)**

This is the
downloaded data,
comes in pair

**Source
Language
Data**

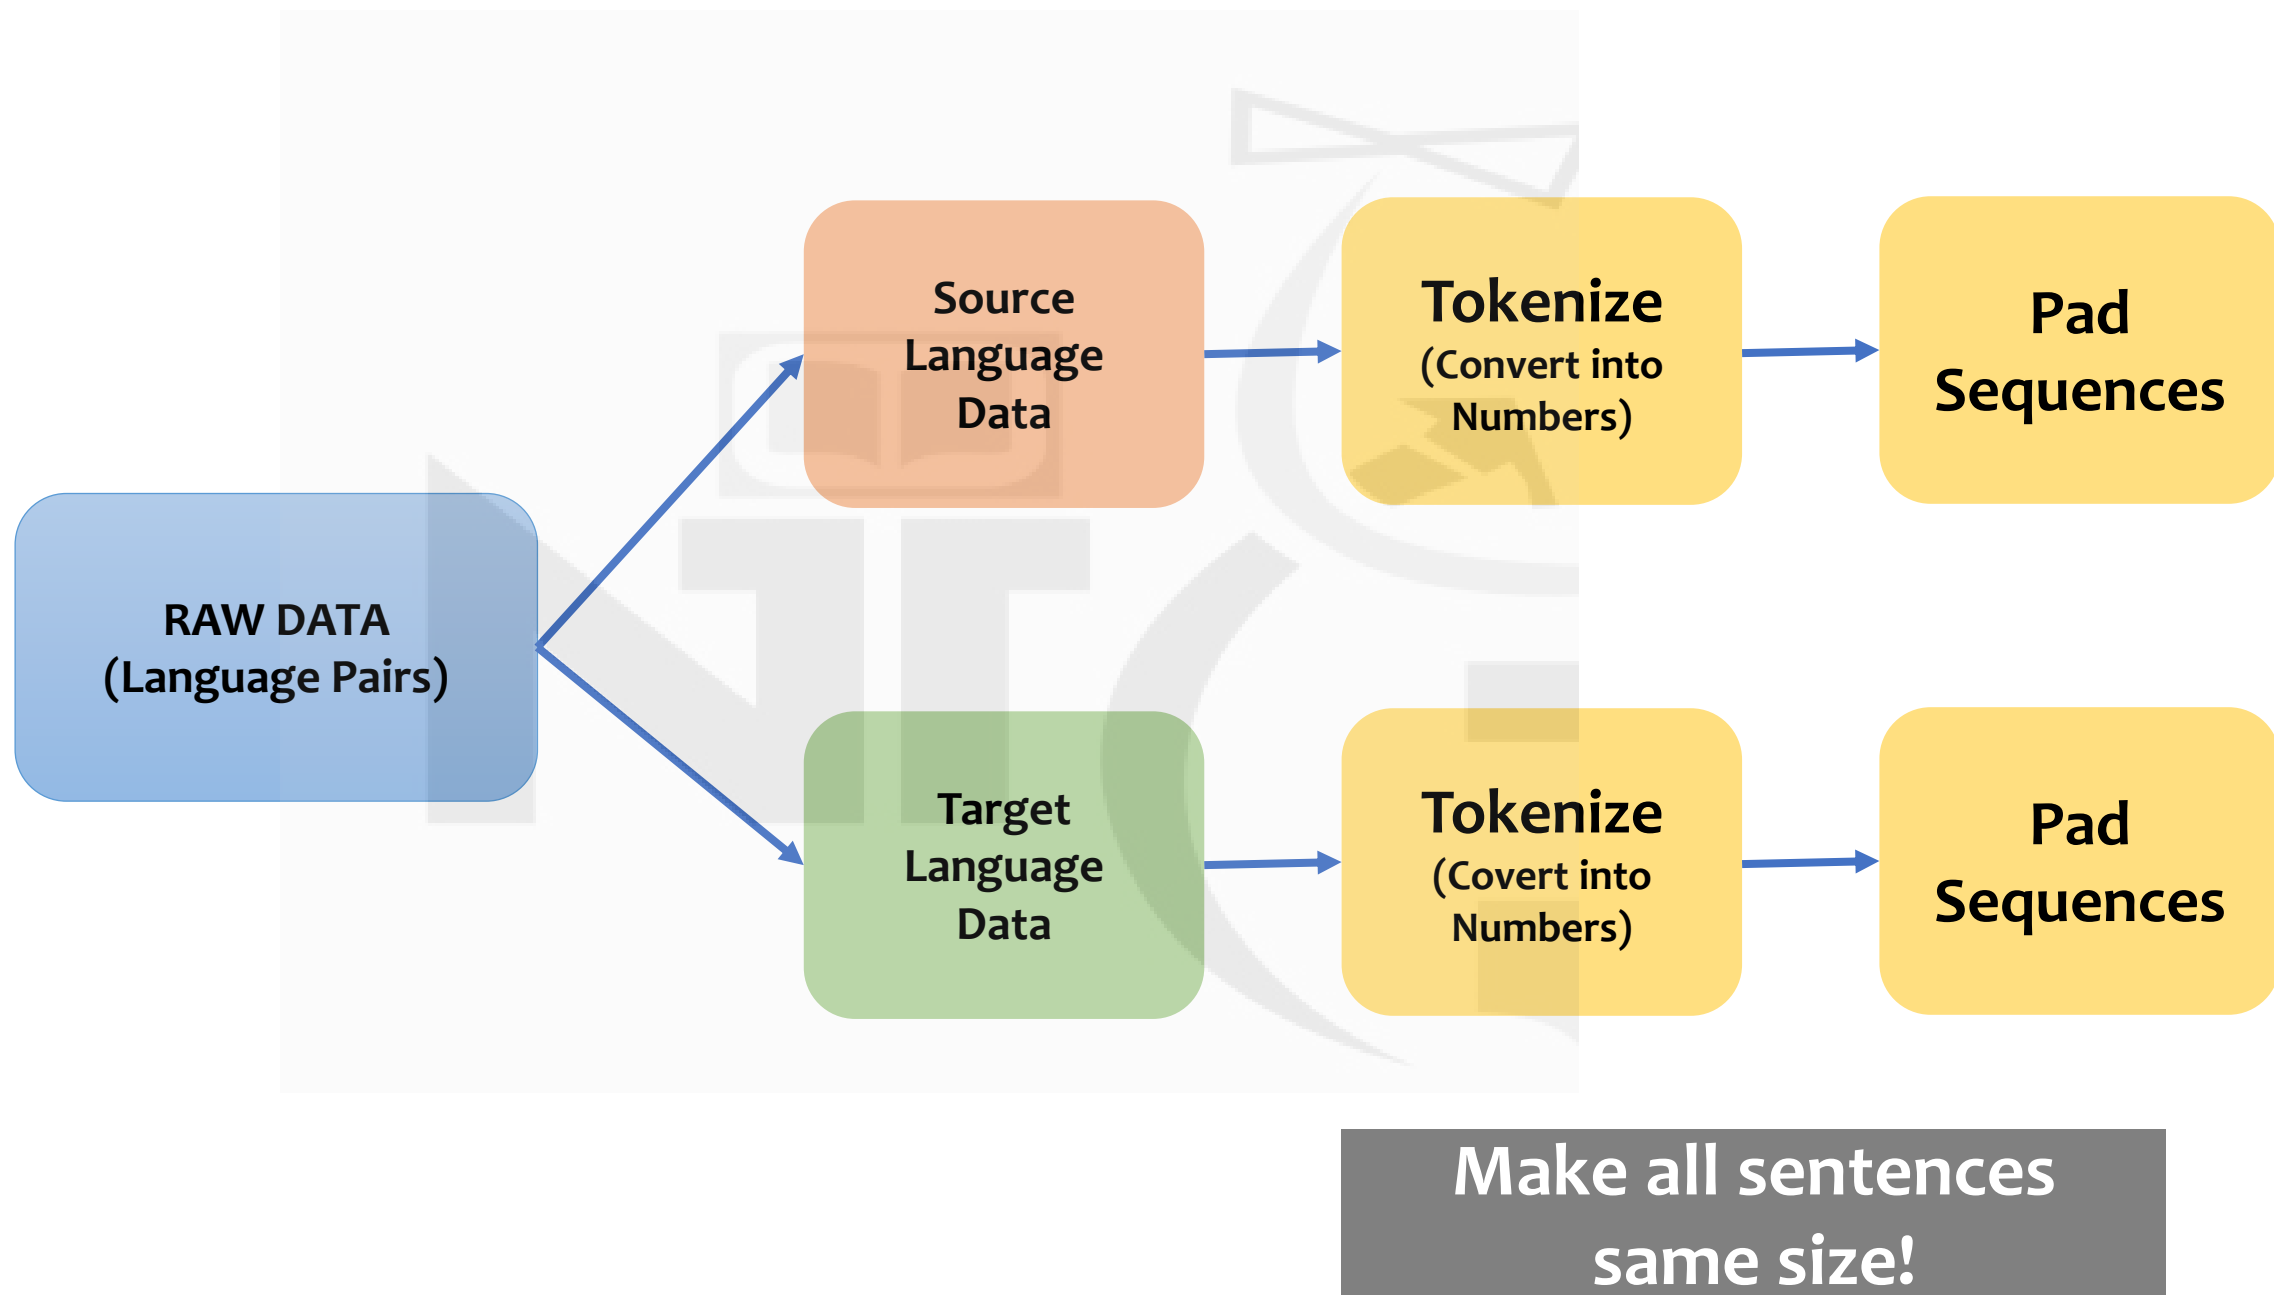

I have a car.
I have a dog.
I understand.
I'm a doctor.
It is a book.

**Target
Language
Data**

<start> मेरे पास एक गाड़ी है। <end>
<start> मेरे पास एक कुत्ता है। <end>
<start> मैं समझता हूँ। <end>
<start> मैं डॉक्टर हूँ। <end>
<start> यह किताब है। <end>

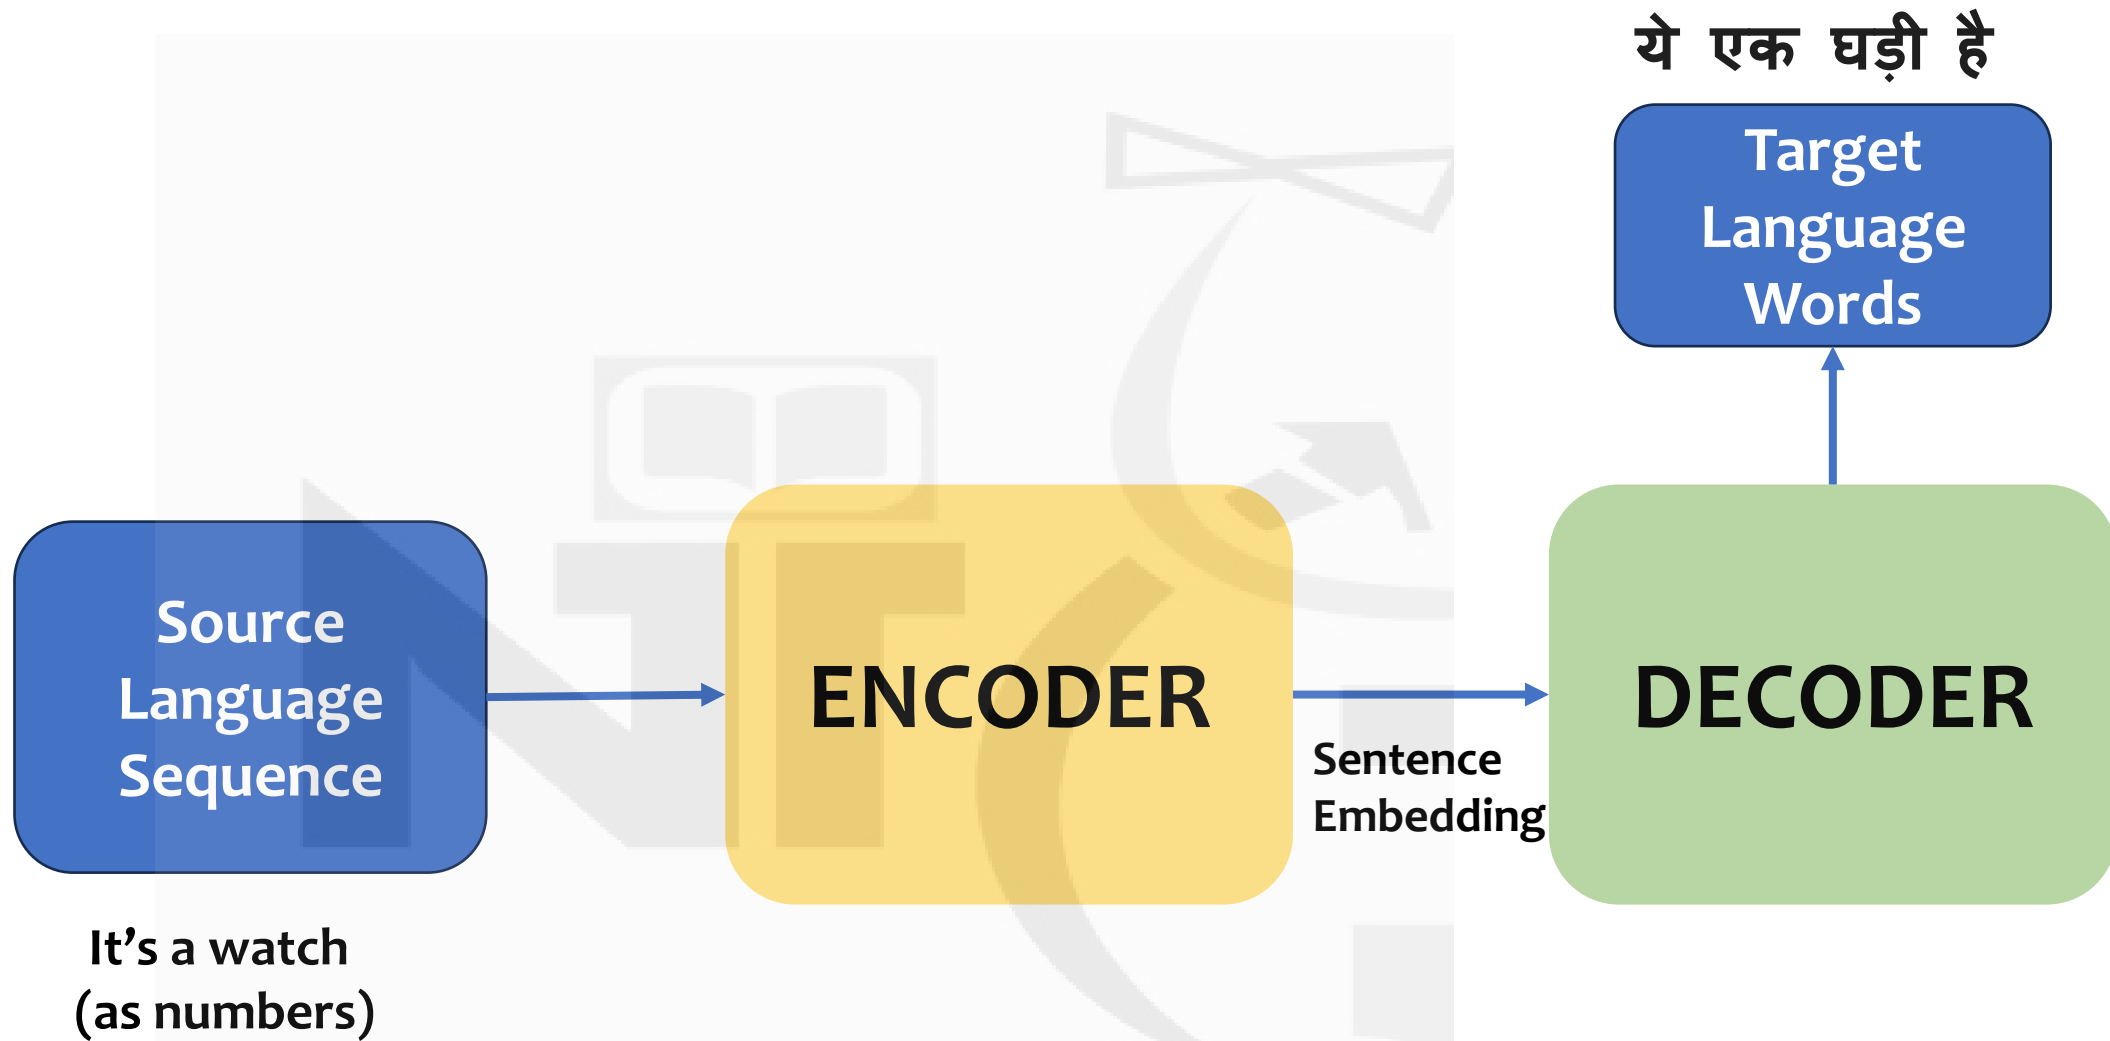

For Target Sequence we will use start and end sequence –
useful during predictions

Building Seq2Seq Model

Sequence to Sequence (Seq2Seq) Model

ये एक घड़ी है

DECODER

It's a watch
(as numbers)

Sequence to Sequence (Seq2Seq) Model

- This approach doesn't usually work well, Decoder struggles
- To help the decoder we feed the actual hindi (target language) sentence as input
- And then we ask the decoder now give me the hindi (target language) sentence
- If the decoder is taking output hindi sentence as input and outputs the same thing then what is decoder doing?
- But the output of decoder is missing the start tag
- So its not an exact copy of input so there is some learning in decoder

DECODER

What is the value ,
Sentence Embedding

LSTM hidden state from each step are fed to the output layer

Padded Target Sequences

Embedding Layer

Fully Connected Layer with Softmax

DECODER

What is the value ,
Sentence Embedding

Working with LSTM layer in Keras

output = LSTM(256) <input>

What will the output of LSTM layer?

output = LSTM(256) <input>

**By default, output is hidden_state
'h' of the last step.**

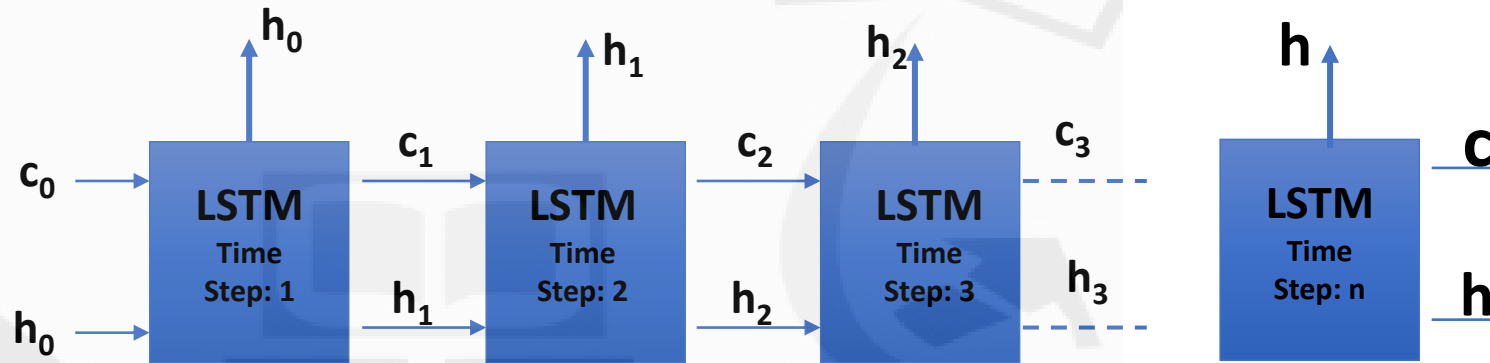

How do I get both 'h' and 'c' of the last step?

output, h, c = LSTM(256, return_state=True) <input>

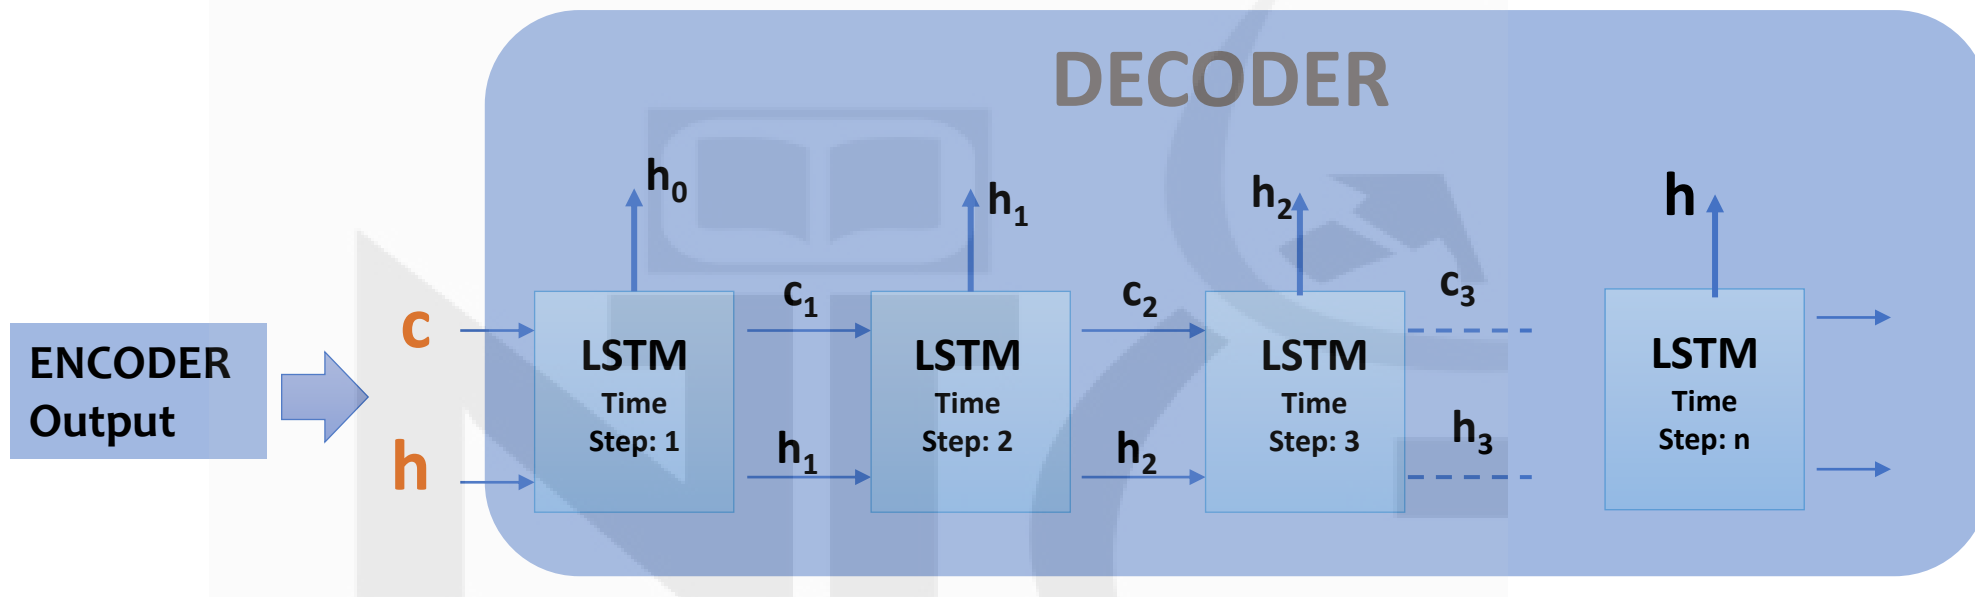

How do I get hidden state 'h' of all steps?

`Outputs = LSTM(256, return_sequences=True) <input>`

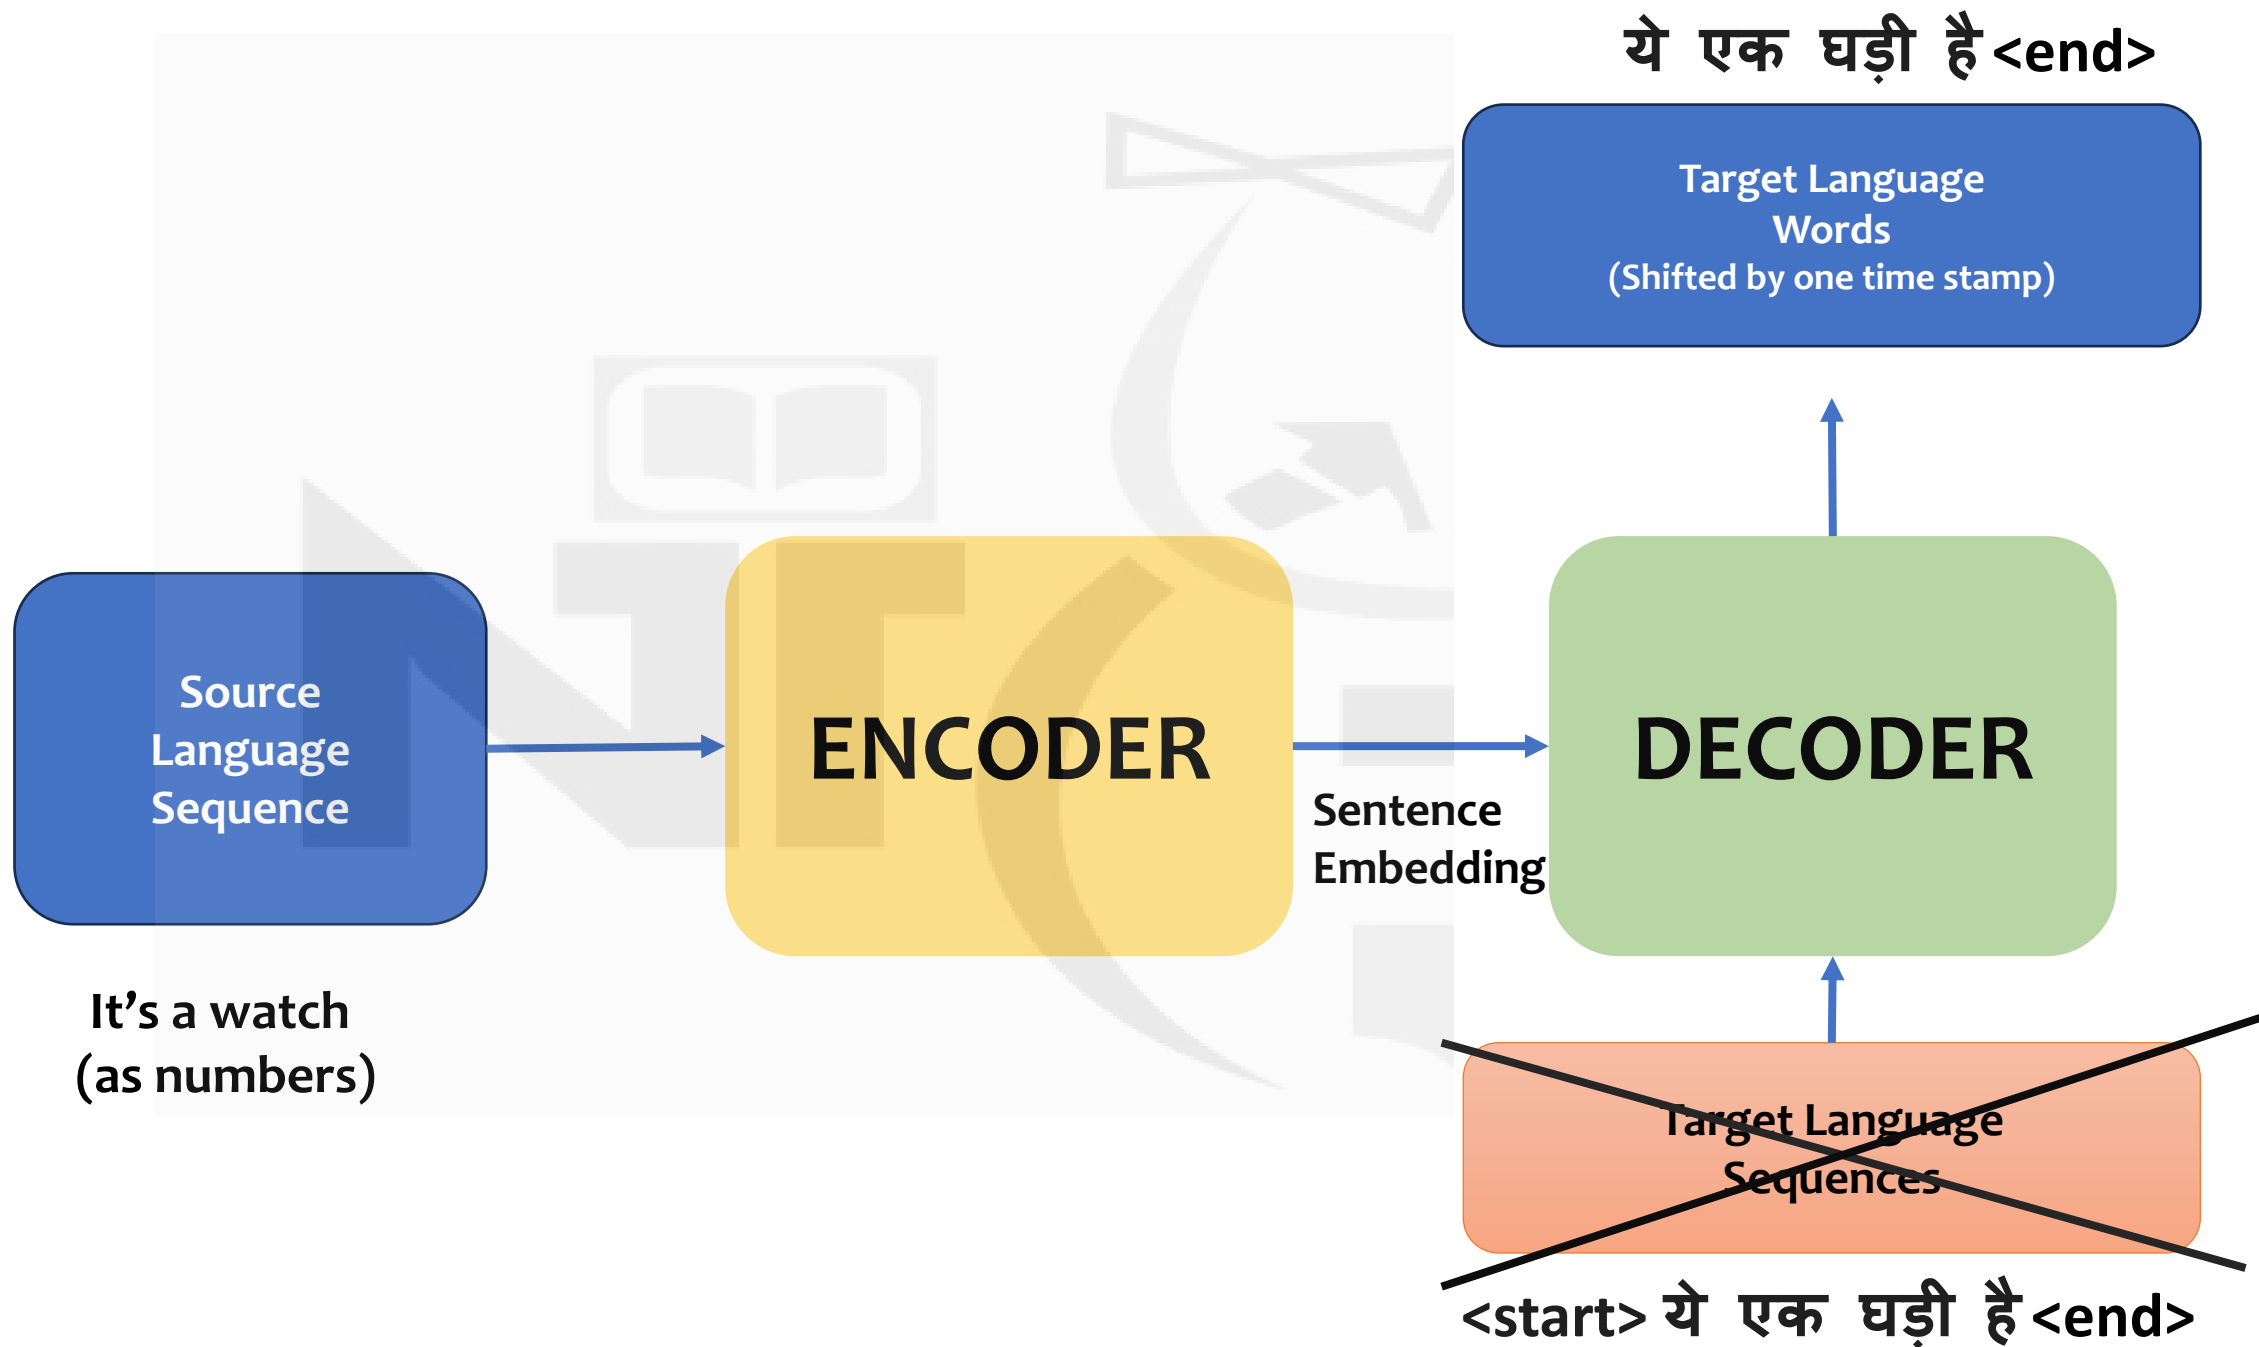

How to feed ENCODER output to DECODER?

```
model_layer = LSTM(256, initial_state=[h,c]) <input>
```

The background of the slide features a large, light gray watermark of the Nanyang Technological University (NTU) logo. The logo consists of the letters 'NTU' in a stylized font, with a book icon above the 'T' and a circular emblem to the right containing a crescent moon and a star.

Building the model for predictor
