

# Iterator Vs Generator

MUKESH KUMAR

# AGENDA

- Iterator Vs Generator
- When to use
- RealTime UseCases
- Conclusion

# Differences

Feature	Iterator	Generator
<b>Definition</b>	A class that implements <code>__iter__()</code> and <code>__next__()</code>	A function that contains <code>yield</code>
<b>Memory Usage</b>	Can store values in memory	Generates values on the fly, uses less memory
<b>Code Complexity</b>	Requires a class and manual state management	Simple function with <code>yield</code> , automatically manages state
<b>Performance</b>	Slower due to explicit state tracking	Faster due to lazy evaluation
<b>Usage</b>	Suitable for complex iteration logic	Best for handling large data streams efficiently

# When to Use Which?

- ✓ Use Iterators when:
  - You need custom behavior for iteration.
  - You want full control over how elements are retrieved.
- ✓ Use Generators when:
  - You need to process large datasets without loading everything into memory.
  - You want to simplify iteration logic with yield.

# RealTime Use Cases

- Refer Notebook

IteratorsNGenerators\_Applications.ipynb

# Conclusion

- Both iterators and generators help in iteration, but generators are memory-efficient and easier to implement.
